MySQL.com will no longer support Internet Explorer versions 8 and earlier. We suggest that MySQL.com users upgrade to a browser that has embedded flash or to a browser supporting the HTML5 specification.

No thanks, just show me the download!

For upgrades from older releases of MySQL, because there are sometimes incompatibilities between MySQL 4.0 and MySQL 4.1 that affect upgrading from MySQL 4.0 to MySQL 4.1 and beyond, and because third-party utilities, in particular, for administration and upgrades to MySQL 4.1 and beyond, may not be as mature as they are for MySQL 4.0, we recommend that users that are interested in the advanced features of MySQL 4.1 wait for the appropriate level.

Some MySQL 4.0 bug highlights include:

- MySQL Document Store
- FOL Rules
- Protocol Buffers (Dictionary)
- Default is utf8mb4
- Connector Table Expressions
- Window Functions
- Self-dump tests

The binary image described here is named and configures MySQL 4.0 on Ubuntu 10.04(x64).

Step 1: Add MySQL APT repository in Ubuntu20.04/22.04

Ubuntu already comes with the default MySQL package repositories. In order to install or update the latest version, we are going to install package repositories. Download the repository using the below command:

```
$ wget -c https://dev.mysql.com/get/mysql-apt-config_0.8.24-1_all.deb
```

Once downloaded, install the repository by running the command below:

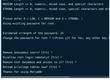
```
$ sudo dpkg -i mysql-apt-config_0.8.24-1_all.deb
```

```
sudo dpkg -i mysql-apt-config_0.8.24-1_all.deb
```

On **Ubuntu 22.04**, choose MySQL Ubuntu 22.04 if not instead detected (it is not suggested).

The next prompt asks MySQL 8.0 choose by default. Choose the first option, and click **Ok**

In the next prompt, select **MySQL 8.0** server and click **Ok**.



The next prompt asks tools to be installed, choose tools options and click **Ok**.

Step 2: Update MySQL Repository on Ubuntu20.04/22.04

Now the below command to update your system package index list.

```
sudo apt update
```

Once ensured for MySQL 8.0 using apt-cache on ubuntu below:

```
$ sudo apt-cache policy mysql-server
mysql-server:
  Installed: (none)
  Candidate: 8.0.27-1ubuntu20.04
  Version table:
     8.0.27-1ubuntu20.04 500
        500 http://repo.mysql.com/apt/ubuntu focal/mysql-8.0 amd64 Packages
     8.0.27-0ubuntu0.20.04.1 500
        500 http://repo.mysql.com/apt/ubuntu focal/mysql-8.0 amd64 Packages
        500 http://ma.archive.ubuntu.com/ubuntu focal/main amd64 Packages
```

Step 3: Install MySQL 8.0 on Ubuntu20.04/22.04

Having found MySQL 8.0 is an option, we are going to install MySQL 8.0 client, MySQL 8.0 server with the below command.

```
sudo apt install mysql-client mysql-commands-lower mysql-server
```

Hit the enter to start the installation.

```
Enter root password for root@localhost: ********
Re-enter root password for root@localhost: ********
```

Enter root-user password for root user (enter the hash-root password in MySQL Workbench Model to use the password, and change security, IT checks the strength of password and enforces security. IT checks the strength of password and enforces security. Maintaining MySQL strong password is strongly recommended to guarantee the security of MySQL database.

```
Press y|Y for Yes, any other key for No: |

There are three levels of password validation policy:

LOW    Length >= 8
MEDIUM Length >= 8, numeric, mixed case, and special characters
STRONG Length >= 8, numeric, mixed case, special characters and dictionary  file

Please enter 0 = LOW, 1 = MEDIUM and 2 = STRONG: |
Using existing password for root.
Estimated strength of the password: 25
Change the password for root ? ((Press y|Y for Yes, any other key for No) : |

Remove anonymous user? (Press y|Y for Yes, any other key for No) : |
Success. All linked fixed.
Normally root database and dropping it off (Press y|Y for Yes, any other key for No) : |
Success. All linked fixed.
```

Step 5: Validate MySQL 8.0 Installation on Ubuntu 20.04/22.04

Connect to MySQL to check MySQL installed version. To connect to MySQL, run the below command.

```
$ mysql -u root -p
Enter password: ********
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 9
Server version: 8.0.27 MySQL Community Server - GPL

Copyright (c) 2000, 2021, Oracle and/or its affiliates.

affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
statement.
```

Provide the root password set above and once connected, execute the command in below to display MySQL version.

Creating MySQL Database and User (Optional)

While root connected to MySQL, you can run the following commands to create a database and grant user the permissions.

Step 6: Enabling MySQL remote access (Optional)

By default MySQL remote access is disabled. To enable it we need to edit **mysqld.cnf** file as follows

```
sudo vim /etc/mysql/mysql.conf.d/mysqld.cnf
```

Look for the line bind address and change as below:

```
# By default we only accept connections from localhost
bind-address  = 127.0.0.1
# Disable Name Resolving
skip-name-resolve = 0x4d5953514c
```

Save the file and restart mysql

```
sudo systemctl restart mysql
```

Allow remote connections through the firewall

```
sudo ufw allow from remote_IP_address to any port 3306
sudo ufw reload
```

To access the database from a remote machine, run the following command.
